Compulsory 1

https://github.com/nicolevbiene/Programming/blob/main/session%201/test.cpp

Functions:
#include <iostream> = library for different functions
using namespace std **or** std:: = to access functions in iostream
int main () = program starting point
cout = referring to show text, printing on screen
endl = end of the line, start at a new one
return = returns control to start calling function
; = commend is over, ready for the next one
:: = to access functions there are in different scopes
{} = define scope
<< = goes in to

Experience:
I learned the hard way that this is a much more complicated coding language than I am used to with processing. Things I thought I knew don't apply to c++. It is harder to set up a project, there have to be files in files. Also, the fact that I have a Mac doesn't make it easier, everyone is confused when they try to help me. The downloading process was testing my patient and almost regretting my choice to switch courses. Buttt, I think it could be very useful and cool, if I get the hang of it, there are endless options.
